Document-relative Vocabulary

```json
{
  "@context": {
    "@version": 1.1,
    "@base": "http://example/document",
    "@vocab": "#"
  },
  "@id": "http://example.org/places#BrewEats",
  "@type": "Restaurant",
  "name": "Brew Eats"
  ...
}
```

```turtle
@prefix : <#> .

:BrewEats a :Restaurant ;
  :name "Brew Eats" .
```

- Better alternative to (deprecated) blank-node properties.

Protected Term Definitions

```json
{
  "@context": [
    {
      "@version": 1.1,
      "Person": "http://xmlns.com/foaf/0.1/Person",
      "knows": "http://xmlns.com/foaf/0.1/knows",
      "name": {
        "@id": "http://xmlns.com/foaf/0.1/name",
        "@protected": true
      }
    },
    {
      – this attempt will fail with an error
      "name": "http://schema.org/name"
    }
  ],
  "@type": "Person",
  "name": "Manu Sporny",
  "knows": {
    "@context": [
      – this attempt would also fail with an error
      null,
      "http://schema.org/"
    ],
    "name": "Gregg Kellogg"
  }
}
```

- Prevents accidental/intentional overriding of term definitions by downstream contexts.

    - Can be overridden in a property-scoped context.
